Summary

This document describes the Building Area function in govern and the required configuration.

Description

The Building Area function is designed to be read only. By default the area are populated from the drawing. We allow the user to set the Area Override. If the Area Override is set, the area must be maintained manually by the user, any changes made in the drawing won't be pass to the area table.

The Building Area must be a child entity of the Building Drawing.

Note v6.0

In 6.0 we support MA_BLDG_AREA and MA_BLDG_AREA_YEAR. MA_BLDG_AREA is the legacy table but we have to keep it until the MA compute is written in .Net. Eventually, all clients will use the MA_BLDG_AREA_YEAR, allowing clients to do a breakdown by year build. The year build is optional

Controller

Functionalities

1. Allow Area Override
 - a. A command is available to the users. If the Area_Override is not turned on, the button is visible
 - b. If the user click on the button, we set the Area_Override in the database.
2. The New/Save/Delete are available only if the Area_Override is true. The information must be available from the parent entity (MA_BUILDING_DRAWING)

Configuration

BED

1. A Default entity In BED using MA_BLDG_AREA or MA_BLDG_AREA_YEAR
2. Link the entity to the Drawing entity.

OFD

No set up.

IET

N/A

Mobile

N/A

Security
